

Abstract**Firearms safety device**

The invention relates to a safety device and a securing method, in particular for securing
5 firearms against unauthorised use. A device according to the invention is provided with at
least one clamping or locking portion that is insertable into a barrel 100 of a firearm and is
optionally lockable and/or unlockable or permanently clampable therein and/or detachable
therefrom. Moreover, it is provided with a control unit, such as an electronic
authentication means that is capable of authenticating a user and, if the user is authorised,
10 makes at least one clamping portion clampable within the barrel of the weapon or
detachable therefrom. The safety device is completely insertable into the barrel. (Fig. 3).
